

How to Level the Post Assembly

1 Position the post assembly in its final location and orientation and anchor it firmly to the surface with the supplied screws through the holes in the mounting plate.

2 Once anchored, use a level to determine if the post is straight. Test both sides of the post. If the post is straight, mounting is complete. If not level, move to next step.

3 Remove the appropriate screws from the mounting plate, slip a #8 washer under the screw holes to shim, and then replace and tighten the screws. Retest for level and make further adjustments if needed.
